

What differs between naturally short and long correct traces?

Primary SAE held-out result

Across six SAEs: 66 held-out confirmations

Displayed token example: hf-000649

short 224 tokens vs long 407 tokens

Interpretation boundary

These results establish association and held-out replication only. A feature may encode wording, formatting, position, or reasoning state. Student utility and causal steering remain separate experiments.

Blue: more active in short traces Red: more active in long traces
